Abstract Algebra (p.18)

CHAPTER 1. PRELIMINARIES

1

PROOF. (1) If $A \cup B = \emptyset$, then the theorem follows immediately since both A and B are empty sets. Otherwise, we must show that $(A \cup B) \subseteq A' \cap B'$ and $(A \cup B) \supseteq A' \cap B'$. Let $x \in A \cup B$. Then $x \in A$ or $x \in B$. So $x \in A'$ or $x \in B'$. In either case, by the definition of the union of sets, $x \in A' \cap B'$. By the definition of the complement, $x \in A' \cap B'$ and we have $(A \cup B) \subseteq A' \cap B'$.

To show the reverse inclusion, suppose that $x \in A' \cap B'$. Then $x \in A'$ and $x \in B'$, and so $x \notin A$ and $x \notin B$. Hence $x \in (A \cup B)'$. The proof of (2) is left as an exercise.

Example 1.4 Other relations between sets often hold true. For example,

$$(A \setminus B) \cap (B \setminus A) = \emptyset$$

To see that this is true, observe that

$$\begin{aligned}(A \setminus B) \cap (B \setminus A) &= (A \cap B') \cap (B \cap A') \\ &= A \cap A' \cap B \cap B' \\ &= \emptyset.\end{aligned}$$

Cartesian Products and Mappings

Given sets A and B , we define a new set $A \times B$ called the *Cartesian product* of A and B of ordered pairs. That is,

$$A \times B = \{(a, b) : a \in A \text{ and } b \in B\}.$$

Example 1.5 If $A = \{x, y\}$ and $B = \{1, 2, 3\}$, then $A \times B$ is the set

$$\{(x, 1), (x, 2), (x, 3), (y, 1), (y, 2), (y, 3)\}$$

and

$$A \times A = \{(x, x), (x, y), (y, x), (y, y)\}.$$

We define the *Cartesian product* of n sets $A_1, A_2, \dots, A_n$ to be

$$A_1 \times A_2 \times \cdots \times A_n = \{(a_1, \dots, a_n) : a_i \in A_i \text{ for } i = 1, \dots, n\}.$$

If $A_1 = A_2 = \cdots = A_n = A$, we often write A^n for $A \times A \times \cdots \times A$ (where A would be written n times). For example, the set $\mathbb{R}^3$ consists of all of 3-tuples of real numbers.

Subsets of $A \times B$ and Mappings A subset R of $A \times B$ is called a *relation*. We will define a *mapping* or *function* f from a set A to a set B to be a special type of relation R between A and B such that for every $a \in A$, there is a unique element $b \in B$ such that $(a, b) \in R$. Another way of saying this is that for every element a in A , f assigns a unique element in B . We usually write $f(a) = b$ or $a \mapsto b$ instead of writing down ordered pairs (a, b) . If f is a function from A to B , we write $f : A \rightarrow B$. The set A is called the *domain* of f and the set B is called the *range* or *image* of f .

$$f(A) = \{f(a) : a \in A\} \subseteq B$$

We can think of the elements in the function's domain as input values and the elements in the function's range as output values.

where

$$\begin{aligned} F_{11}(u_n, v_n, \delta) &= -\frac{(1+b)x^*\delta}{2a} - \frac{a \sin x^* u_n^2}{2} - \frac{(1+b)x^*\delta^2}{4a^2} \\ &\quad - \frac{a \cos x^* u_n^3}{6} - \frac{(1+b)x^*\delta^3}{8a^3} + O(\|(u_n, v_n, \delta)\|^4), \\ F_{12}(u_n, v_n, \delta) &= -\frac{(-x^*b^2 + 2a \sin x^* - 2x^*b - x^*)\delta}{2a} \\ &\quad + \frac{a(b-1) \sin x^* u_n^2}{2} + \frac{(1+b)^2 x^* \delta^2}{4a^2} - \cos x^* \delta u_n \\ &\quad + \frac{a(b-1) \cos x^* u_n^3}{6} + \frac{(1+b)^2 x^* \delta^3}{8a^3} + \frac{\sin x^* \delta u_n^2}{2} \\ &\quad + O(\|(u_n, v_n, \delta)\|^4). \end{aligned}$$

Consider the following system

$$\begin{pmatrix} u_{n+1} \\ v_{n+1} \\ \delta_{n+1} \end{pmatrix} = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} u_n \\ v_n \\ \delta_n \end{pmatrix} + \begin{pmatrix} \hat{F}_{11}(u_n, v_n, \delta_n) \\ \hat{F}_{12}(u_n, v_n, \delta_n) \\ 0 \end{pmatrix}, \quad (15)$$

where

$$a_{11} = -1 + a \cos x^*, \quad a_{12} = 1,$$

then the system (15) becomes

$$\begin{pmatrix} x_{n+1} \\ \tilde{y}_{n+1} \\ \tilde{\delta}_{n+1} \end{pmatrix} = \begin{pmatrix} -1 & 0 & 0 \\ 0 & -b + a \cos x^* & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \tilde{x}_n \\ \tilde{y}_n \\ \tilde{\delta}_n \end{pmatrix} + \begin{pmatrix} \tilde{F}_{11}(\tilde{x}_n, \tilde{y}_n, \tilde{\delta}_n) \\ \tilde{F}_{12}(\tilde{x}_n, \tilde{y}_n, \tilde{\delta}_n) \\ 0 \end{pmatrix}, \quad (16)$$

where

$$\begin{aligned} \tilde{F}_{11}(\tilde{x}_n, \tilde{y}_n, \tilde{\delta}_n) &= -\frac{\tan x^* \sec x^* \tilde{x}_n^2}{2a} - \frac{\tan x^* \tilde{x}_n \tilde{y}_n}{b-1} + \frac{\sin x^* \tan x^* \tilde{\delta}_n \tilde{x}_n}{2 \cos x^* (a-2b-2)} \\ &\quad - \frac{a \sin x^* \tilde{y}_n^2}{2(b-1)^2} + \frac{a \sin^2 x^* \tilde{y}_n \tilde{\delta}_n}{2(b-1)(a \cos x^* - b-1)} \\ &\quad - \frac{\tilde{\delta}_n^2}{8(a \cos x^* - b-1)^2 a^2} \left((2x^*(b+1)^3 + a^3 \sin^3 x^* \right. \\ &\quad \left. - 4ax^*(b+1)^2 \cos x^* + 2a^2 x^*(b+1) \cos^2 x^*) \right) \\ &\quad + \frac{\sec^2 x^* \tilde{x}_n^3}{6a^2} + \frac{\sec x^* \tilde{x}_n^2 \tilde{y}_n}{2a(b-1)} - \frac{\tan x^* \tilde{x}_n^2 \tilde{\delta}_n}{4a(a \cos x^* - b-1)} \end{aligned}$$
